
Sperm DNA Damage reduces the success of Fertility Treatments

SpermComet[®]
The Next Generation Test For Men's Health

SPERM DNA TESTING

Sperm DNA damage can reduce the success rates of Fertility Treatments.

Many couples trying for a baby through fertility treatments may be missing out on information that could improve their chances.

While a conventional semen analysis test will reveal basic problems – like not enough sperm – the quality of the sperm can only be assessed by looking at its DNA. If the sperm DNA damage level is high, then **the best chance of success might be going straight to ICSI treatment rather than starting with IVF.**

We work with your fertility clinic to help reduce the loss of valuable time and financial costs on treatments with a lower chance of success.

SpermComet® reveals your Sperm DNA Health.

To find out more about the SpermComet® test you can talk to your Fertility Clinic.
